## INTRODUCTION

The Thirteenth Bulletin of North Carolina Morbidity Statistics, covering the calendar year 1944, contains the tabulations listed in previous bulletins.

In 1944 there were received 68,278 case reports as compared to 54,509 in 1943 and 66,775 in 1942. Measles reports were heavy in 1944 and 1942, thus accounting for the major part of the difference in the total cases reported for the three years, while an epidemic of 861 cases of poliomyelitis added to the 1944 figure.

Of the nine diseases listed in 1943 as showing a definite downward trend for a ten-year period, four have failed to continue this trend in 1944. These four are paratyphoid fever, tuberculosis, typhoid fever, and undulant fever. The five diseases that have continued their downward trend are diphtheria, malaria, ophthalmia neonatorum, pellagra, and syphilis. 1944 is the first year that no ophthalmia neonatorum cases have been reported.

Of the three diseases showing a ten-year upward trend in 1943 (chancroid, endemic typhus fever, and gonorrhea) endemic typhus fever and gonorrhea have continued upward. Rocky Mountain spotted fever must now be included in this group. Endemic typhus fever cases were more numerous than in any of the previous ten years. A decline in chancroid occurred this year for the first time. The increase in gonorrhea is the smallest increase reported in the past ten years.

Syphilis is now in its fifth year of decline. The reduction has been limited to late cases, however, while early cases have continued to be reported at approximately the same rate for the past three years.

The summer of 1944 brought North Carolina's second poliomyelitis epidemic and the largest number of cases ever recorded for the state. The west central section of the state was involved, the majority of the cases being confined to a band approximately 75 miles wide extending from the northern to the southern borders.

Changes in the number of reports of the remaining reportable diseases have been numerous but without great importance.

On December 14, 1944 a new list of reportable diseases was adopted by the North Carolina State Board of Health to become effective January 1, 1945. The new list will appear in the 1945 Morbidity Bulletin. Reporting of the following diseases was discontinued: chicken pox, German measles, influenza, pellagra, and Vincent's infection. In the future ophthalmia neonatorum cases will be included in the total for gonorrhea. The following additional diseases were required to be reported for 1945: amoebic dysentery, encephalitis, glanders, granuloma inguinale, leprosy, and lymphogranuloma venereum.

## INTRODUCTION

The Thirteenth Bulletin of North Carolina Morbidity Statistics, covering the calendar year 1944, contains the tabulations listed in previous bulletins.

In 1944 there were received 68,273 case reports as compared to 54,509 in 1943 and 66,775 in 1942. Measles reports were heavy in 1944 and 1943, thus accounting for the major part of the difference in the total cases reported for the three years, while an epidemic of 861 cases of poliomyelitis added to the 1944 figure.

Of the nine diseases listed in 1943 as showing a definite downward trend for a ten-year period, four have failed to continue this trend in 1944. These four are paratyphoid fever, tuberculous, typhoid fever, and undulant fever. The five diseases that have continued their downward trend are diphtheria, malaria, ophthalmia neonatorum, pellagra, and syphilis. 1944 is the first year that no ophthalmia neonatorum cases have been reported.

Of the three diseases showing a ten-year upward trend in 1943 (schistosomiasis, endemic typhus fever, and gonorrhea) endemic typhus fever and gonorrhea have continued upward. Rocky Mountain spotted fever must now be included in this group. Endemic typhus fever cases were more numerous than in any of the previous ten years. A decline in schistosomiasis occurred this year for the first time. The increase in gonorrhea is the smallest increase reported in the past ten years.

Syphilis is now in its fifth year of decline. The reduction has been limited to late cases, however, while early cases have continued to be reported at approximately the same rate for the past three years.

The summer of 1944 brought North Carolina's second poliomyelitis epidemic and the largest number of cases ever reported for the state. The most central section of the state was involved, the majority of the cases being confined to a band approximately 75 miles wide extending from the northern to the southern borders.

Changes in the number of reports of the remaining reportable diseases have been numerous but without great importance.

On December 14, 1944 a new list of reportable diseases was adopted by the North Carolina State Board of Health to become effective January 1, 1945. The new list will appear in the 1945 Morbidity Bulletin. Reporting of the following diseases was discontinued: chicken pox, German measles, influenza, pellagra, and Vincent's infection. In the future ophthalmia neonatorum cases will be included in the total for gonorrhea. The following additional diseases were required to be reported for 1945: anobiotic dysentery, encephalitis, glanders, granuloma inguinale, leprosy, and lymphogranuloma venereum.
